## \*\*\* : The Hubert index is a graphical method of determining the number of
clusters.
## In the plot of Hubert index, we seek a significant knee th
at corresponds to a
## significant increase of the value of the measure i.e the s
ignificant peak in Hubert
## index second differences plot.
##

```
## *** : The D index is a graphical method of determining the number of clust
ers.
##
                  In the plot of D index, we seek a significant knee (the si
gnificant peak in Dindex
                  second differences plot) that corresponds to a significant
increase of the value of
##
                  the measure.
##
## *********************
## * Among all indices:
## * 6 proposed 2 as the best number of clusters
## * 13 proposed 3 as the best number of clusters
## * 1 proposed 7 as the best number of clusters
## * 1 proposed 10 as the best number of clusters
## * 1 proposed 13 as the best number of clusters
## * 1 proposed 14 as the best number of clusters
##
##
                     ***** Conclusion *****
##
## * According to the majority rule, the best number of clusters is 3
##
nb_clust

## Conclusion

Based on the above visualizations we can conclude that we can cluster our dat a based on audio properties in 3 clusters.

Cluster 1: High acousticness, Low danceability, energy, valence

Cluster 2: Low acousticness, high danceability, energy, valence

Cluster 3 : Low acousticness, moderate danceability, energy, valence
